

ENDURANCE TEAM BUILDER

How the Pro / Casual system works

A plain-language guide for EDR admins

PRO

CASUAL

Three tools, one clear job each

GARAGE 61

PERFORMANCE

Pulls every driver's practice laps: pace, lap count and clean-lap %, per car.

Owns the telemetry

TEAM BUILDER

THE SPLIT

Turns that data into a Pro / Casual split for each car class, then balanced teams.

Owns nothing — you feed it

iRACEPLAN

AVAILABILITY

Holds the availability survey and builds the stint rotation across the race.

Owns availability

KEY PRINCIPLE

Performance and availability are kept separate. The builder only knows who has practised — not who is free to race.

The workflow for an event

1 PULL

GARAGE 61

Run the pull script. It produces a roster.json — each driver's laps, pace and clean-% per car.

2 BUILD

TEAM BUILDER

Import the roster. It ranks drivers, tags each Pro or Casual, and builds balanced teams.

3 ASSIGN

IRACEPLAN

Carry the Pro / Casual labels in. iRacePlan shows availability and builds the stint rotation.

Back up every roster.json in the Planning folder — the files are the durable record, not any chat.

What we measure: three signals

Every driver is scored on three things, each pulled straight from Garage 61 practice data.

PACE

default
50%

Median clean lap time

Faster lap = higher score. The single biggest factor.

CLEAN

default
30%

Clean-lap %

The share of laps with no off-track or wall contact. Tidier = higher.

PREP

default
20%

Number of practice laps

More laps run = higher. Rewards who has put in the work.

The weights are sliders — admins can dial pace up or down to taste before generating teams.

How the score is calculated

$$\text{score} = \text{pace} \times W_{\text{pace}} + \text{clean} \times W_{\text{clean}} + \text{prep} \times W_{\text{prep}}$$

STEP 1 – NORMALISE

Each signal is scaled to a 0–1 score, comparing each driver only against others in the same class.

Fastest in class → 1.0 on pace. Most laps → 1.0 on prep. And so on.

STEP 2 – WEIGHT & RANK

The three 0–1 scores are blended using the weights, giving one number per driver.

Drivers are then ranked within their class by that score.

Always compared within a class

A GTP lap is never ranked against a GT3 lap. Pace, prep and clean are normalised inside each class — never across.

GTP

Acura ARX-06, Cadillac V-Series.R, Porsche 963

LMP2

Dallara P217

GT3

Ferrari 296, BMW M4 EVO, Porsche 911, Merc-AMG, Aston, Mustang

The class is read automatically from the car name (e.g. "GTP", "P217", "GT3").

The Pro / Casual cut

Within each class, ranked drivers are split: the top slice become **Pro**, the rest **Casual**.

PRO = TOP **X%** OF EACH CLASS

Default cutoff is 40% (shown above). It's a slider — slide it up for more Pro entries, down for fewer.

Building balanced teams

Inside each tier, drivers are dealt into multi-driver car entries using a snake draft, so talent is spread evenly — no stacked car.

SNAKE DRAFT

Pick 1 → Car A

Pick 2 → Car B

Pick 3 → Car B

Pick 4 → Car A

Pick 5 → Car A

Pick 6 → Car B

order reverses each round ↑↓

- **Strongest and weakest balance out**
Each car ends with a fair mix of the tier's pace.
- **Separate pools per class & tier**
Pro and Casual are drafted independently, class by class.
- **Team sizes auto-fit**
Drivers are grouped into entries of ~2–3, sized to the pool.

What it does — and doesn't — do

WHAT IT DOES

Admins stay in control

Move any driver between cars, reassign their car, or remove them — the tool just proposes a starting point.

Clean-lap ratio, not incidents

“Cleanliness” uses Garage 61's clean-lap %, not iRacing incident points — one simple source.

Saved on your computer

The roster and settings persist locally in the browser. Share the HTML file to share the tool.

WHERE IT STOPS

It does NOT know availability

Who's free for which stint lives only in iRacePlan and can't be exported — so scheduling stays there.

It does NOT pull data itself

You feed it the roster.json from the Garage 61 pull; the builder never calls the API.

It does NOT pick the final lineup

It ranks and balances on performance. The human call — and timing — happens in iRacePlan.

THE WHOLE THING IN ONE LINE

Garage 61 measures pace, prep & cleanliness → **Team Builder**
ranks within class and splits Pro / Casual → **iRacePlan** handles
availability & stints.
